Forward conditional prevalence

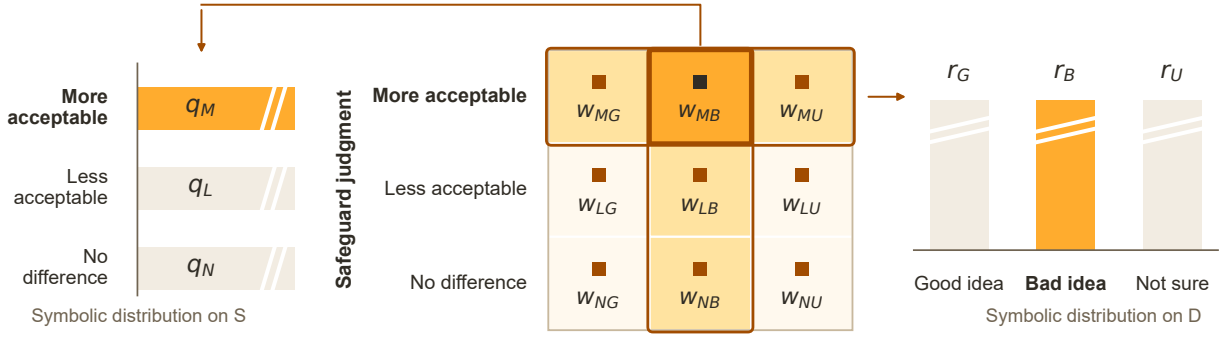

More acceptable among Bad idea

Joint distribution

Two answers from the same respondent

Reverse conditional prevalence

Bad idea among More acceptable

$q_M = P(S = M \mid D = B) = w_{MB}/w_{+B}$

$r_B = P(D = B \mid S = M) = w_{MB}/w_{M+}$

Conditioning set

Bad idea column

Estimand

More acceptable within that conditioning set

Deployment evaluation

Evaluative coexistence

Joint prevalence

$P(D = B, S = M) = w_{MB}/w_{++}$

Highlighted cell / both-item-valid sample

Conditioning set

More acceptable row

Estimand

Bad idea within that conditioning set

Column denominator

w_{+B}

Both-item-valid denominator

w_{++}

Row denominator

w_{M+}

Same highlighted cell; different denominators. Broken bars do not represent observed frequencies.

D: deployment evaluation; S: comparative safeguard judgment; w: summed survey weight; +: summation.
